Tula and Tula Province) [Tula] Tul'skoye knizhnoye izd-vo, 1956.  
78 p. 3,000 copies printed.

Ed. (Title page): I.P. Fominykh, Candidate of Technical Sciences;  
Ed. (Inside book): M.N. Tytkin; Tech. Ed.: L.I. Pulin.

PURPOSE: This book is written in simplified technical language by specialists  
in the field of casting for foundry workers and for the general public.

COVERAGE: This book contains articles describing recent developments and  
innovations in foundry practice. The articles deal with a method of steel  
casting which produces easily removed dead heads, chill casting of mining  
machine parts, chill casting of bronze, and the utilization of resins for  
mold mixtures. No personalities are mentioned. References are given at  
the end of each article

TITLE: Peculiarities of Magnesium Distribution During Annealing  
of Magnesium-Treated Malleable Iron (Osobennosti raspredeleniya magniya pri otzhige magniyevogo kovkogo chuguna)

PERIODICAL: Liteynoye proizvodstvo, 1958, Nr 8, pp 10-11 (USSR)

ABSTRACT: The effect of magnesium on the formation of spheroidal graphite has been studied since the discovery of magnesium iron [Ref. 1-7]. The purpose was to study the behaviour of manganese in the process of annealing, e.g. the redistribution of magnesium between the metal and the graphite. The study was carried out on specimens of iron of different composition and with the use of a device for localized spectrum analysis (described and illustrated by a diagram). It was stated that silicon, solved in metal, ties magnesium, and hence an increased silicon content in iron entails an increased solubility of the manganese therein. The bond between the atoms of silicon and magnesium impedes the transfer of magnesium from the matrix (austenite) into the graphite during the process of annealing. In low-silicon iron.

TITLE: Speeding up the Annealing of Malleable Cast Iron Modified by Boron and Bismuth

PERIODICAL: Izvestiya vysshikh uchebnykh zavedeniy. - Chernaya metallurgiya, 1960, No. 8, pp. 153 - 159

TEXT: At the Gor'kovskiy avtozavod (Gor'kiy Automobile Works), where malleable cast iron had been modified by boron and bismuth (Ref. 7), the annealing time had been out from 60 to 35 - 36 hours (annealing in electric 25-t chamber furnace). The Tul'skiy kombaynovyy zavod (Tula Harvesting Combine Works), aided by Tul'skiy mekhanicheskii institut (Tula Institute of Mechanics), utilized the Gor'kiy works experience and attempted to obtain malleable cast iron with raised strength on account of the predominating perlite component. Cast iron K4-45-5 (Kch-45-5) used for the experiments had the following composition: (in%): 2.45-2.8 C; 0.9-1.3 Si; 0.45-0.65 Mn; not above 0.12 S; 0.15 P, and 0.07 Cr. It was smelted in a cupola furnace and superheated in an acid electric furnace. The powdered modifier consisted of ferro-silico-boral (an alloy of iron-silicon-boron-

-aluminum, with 5-15% B) and metallic bismuth, and was placed in a paper bag and held into the metal jet during pouring into the ladle; 0.003-0.004% B and 0.002-0.003% Bi was used (of the metal weight). Parts for a new machine were cast from modified cast iron. The parts and specimens were annealed in laboratory ~~PN-11~~ (PN-11) chamber furnaces. Three microphotograph sets show the structure of the initial and of the modified cast iron (a and b, Figs. 1,3,4). It was stated that boron and bismuth refined dendrites; the modified iron contained a considerably higher quantity of carbides; it was assumed that cementite of modified iron contained less carbon and hence had other properties than usual, viz. lower stability, which had been proven by I.F. Kurtov et al. (Ref. 7); graphite grains were refined. Five different annealing process versions were tried to study the decomposition rate of primary cementite in the first stage of graphitization. It was considerably more intense in modified cast iron than in the initial cast iron. Cementite of modified cast iron was less stable at all temperatures between 850 and 1,050°C, and the metal had a high tendency to chilling at usual and higher Si content. The finally chosen annealing schedule is shown in Figure 6, with a total time of only 8 hours. It produced malleable cast iron with a tension strength not below 45 kg/mm<sup>2</sup> and an elongation of 5% and more only when the boron-

Speeding up the Annealing of Malleable Cast Iron Modified by Boron and Bismuth

-bismuth modifier was used. The experimental results fully confirmed the data obtained by I.F. Kurtov (Ref. 7) and N.G. Girshovich (Refs. 2,8) and proved that addition of boron and bismuth greatly speeds up the annealing of malleable cast iron and improves graphitization but has no marked effect on strength. The author points out that in American practice high-strength cast iron with lowered plasticity is used very extensively, and suggests the application of such cast iron with an ultimate strength which is higher by a factor of 1.5. There are 6 figures and 8 Soviet references.

TITLE: Properties, structure and machinability of malleable cast iron with chromium and antimony for fittings

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 11, 1961, 3, abstract 11018 ("Sb. tr. Tul'sk. mekhan. in-ta", 1960, no. 15, 20-26)

TEXT: An increase in the chromium content of the metal, when alloyed steel gets into the charge, causes a considerable prolongation of the annealing cycle and also tool breakage during the working of fittings as a result of insufficient annealing in the first stage. Investigations showed that a Cr-content of 0.15% is neutralized by the addition of 0.23% Sb to the cast iron. Cast iron containing 2.56% C, 1.5% Si, 0.15% Cr, 0.23% Sb, after heating to 960°C for 3 hours, holding of 15 hours, cooling down to 720°C for 2 hours and holding at this temperature for 10 hours, had the structure of pearlite malleable cast iron of the KY-54-5 (KCh-54-5) grade. Tests of the machinability showed that in the time interval between the sharpening of the taps 5-6 times more fittings from malleable cast iron alloyed with chromium and antimony (HB 170-200) could be

TITLE: Absolute measurement of neutron source yield by the manganese activation method

SOURCE: Atomnaya energiya, v. 16, no. 3, 1964, 253-255

TOPIC TAGS: neutron source yield, measurement, manganese activation method, Mn sup 56, thermal neutron, dipping counter calibration, neutron yield

ABSTRACT: The method of manganese activation for measuring absolute neutrons is used most widely in metrological institutions. This method is based on the absolute measurement of Mn<sup>56</sup> activity, obtained under the influence of source neutrons placed in the center of a large tank filled with a solution of manganese sulfate. Since the thermal neutrons are absorbed by manganese, hydrogen and sulfur nuclei, the number of source emitted neutrons can be determined from the equation

$$Q = \frac{Q_{Mn} \sigma_{Mn} + Q_H \sigma_H + Q_S \sigma_S}{Q_{Mn} \sigma_{Mn}} Q_{Mn} \quad (1)$$

ACCESSION NR: AP4020335

where  $Q_{Mn}$ ,  $Q_S$ ,  $Q_H$  are the manganese, sulfur and hydrogen nuclei in 1 cc. solution;  $\sigma_{Mn}$ ,  $\sigma_S$ ,  $\sigma_H$  are corresponding cross sections of capture of thermal neutrons;  $Q_{Mn}$  is the complete manganese activity. Dipping counter calibration was established. Indeterminacy in the value of a given amount caused an error in absolute  $\beta$ -count which was  $\pm 1\%$ . Neutron yield was computed. Corrections in background, decay during measuring and finite irradiation time of the solution were introduced into the number of readings during measurements with the dipping counter. Neutron dosimetry (Neytronnaya dozimetriya) Moscow, Izd-vo Standartov, 1964.

112 p. Illus., biblio., appendixes, fold-in chart. 300 copies printed.

Scientific editor: G. A. Dorofeyev; Editor: A. L. Shevchenko; Technical

editor: V. A. Murashova; Proofreader: A. P. Yachnichkina.

TOPIC TAGS: neutron density, neutron detection, neutron dosimetry, neutron flux, neutron radiation, radiometry

PURPOSE AND COVERAGE: This book was written for personnel concerned with checking and calibrating neutron dosimeters, radiometers, and neutron radiators, and also for those who use these instruments. It may be of use also for students at vuzes specializing in the field of the dosimetry of ionizing radiations. The book begins with a brief presentation of the most important concepts in neutron dosimetry, their properties, and classification of neutrons according to energy; then the characteristics of different neutron sources are presented, the processes of the interaction of neutrons with materials and biological tissue are analyzed, and methods and instruments utilized for measuring the density of neutron fluxes and

AUTHOR: Fominykh, V. I.

TITLE: Comparing neutron radiators<sup>19</sup> having different spectra

SOURCE: Izmeritel'naya tekhnika, no. 6, 1965, 43-46

TOPIC TAGS: neutron radiation, neutron spectrum

ABSTRACT: Comparison of the yields of two neutron sources having different spectra by means of a flat-response counter is considered. The counter efficiency is constant, with an error of  $\pm 8\%$ , within neutron energies of  $40 \times 10^{-16}$  to  $14 \times 10^{-13}$  joules. A formula is developed for the unknown yield of a neutron source which is compared with a reference source by a flat counter; also, a formula for calculating the error involved is derived. In a comparison of a RaBe ( $\alpha, n$ ) source with a PuBe ( $\alpha, n$ ) source, these recommendations are given: (1) The same distance from both sources; (2) Allowance for stray

Card 1/2

L 2599-66

ACCESSION NR: AP5019200

radiation; (3) Correction for the effective center; (4) It is desirable that the source yields do not differ more than 5 times. The flat-response counter may also be used for comparing neutron sources of the same type and as a reference instrument for measuring fast-neutron fluxes. Orig. art. has: 21 formulas and 1 table.

SOURCE: Atomnaya energiya, v. 19, no. 2, 1965, 181-183

TOPIC TAGS: neutron distribution, radioactive source, neutron, radium, beryllium, radiation counter

ABSTRACT: The relative measurements of the Canadian Ra-Be neutron source were carried out considering the neutron distribution in open geometry and using a long counter which could turn the source at any required angle. With the source axis of rotation coinciding with the cylinder axis, the asymmetry was 1% and with the source axis turned to the side of the surface it was 1.5%. The relative measurements for the source indicated 3.25 neutrons/sec. Orig. art. has 2 figures and 1 table. NA7

TITLE: Damping emission of the tungsten anode in the region of 25 - 250 A wave length

55, 27

SOURCE: Optika i spektroskopiya, v. 19, no. 5, 1965, 800-808

TOFIC TAGS: tungsten, absorption spectrum, spectral distribution, electrode

ABSTRACT: A method of measuring the relative intensities for a wide spectral range was investigated. The spectral distribution in the spectral region of 25 - 250 A of a tungsten anode was obtained corresponding to the 24 - 5 kv accelerating potentials. Such a damping emission could be used for an investigation of absorption spectrums with a high energy resolution. The distribution of the intensity in the damping spectrums of tungsten anodes for 70 - 120 v accelerating potentials was also investigated. A sharp structure was detected near the short-wave boundary of the spectrum. Orig. art. has: 10 figures and 4 formulas.

TITLE: Producing thin nickel film on porcelain by a chemical nickel-plating process

SOURCE: Priborostroyeniye, no. 11, 1964, 16-18

TOPIC TAGS: nickel plating

ABSTRACT: The results of experiments with chemical plating of 0.1-0.2-micron nickel film on 20-cm<sup>2</sup> porcelain plates and 4.7-cm<sup>2</sup> porcelain cylinders are reported. The best method found of pretreating the porcelain surface includes the following: sensibilization in a solution of 70 g/lit SnCl<sub>2</sub> and 40 ml/lit HCl for five min at 20C; washing in acidified water and drying; activation in a 1 g/lit solution of palladium chloride, pH = 2-3, for 5 min at 20C with subsequent drying;

Card 1/2

L 19721-65

ACCESSION NR: AP4048839

treatment with a 5% solution of  $\text{NaH}_2\text{PO}_2$  for 30 sec with subsequent washing; a second activation by the same palladium-chloride solution for 30-60 sec and drying. The nickel plating was performed in a nickel-chloride solution (30 g/lit with  $\text{NaH}_2\text{PO}_2$  (10 g/lit) doped by various additions (sodium citrate, succinic acid, glycocoll, etc.). The rate of plating, evaluation of quality, and methods of checking the liquor are indicated. Orig. art. has: 2 tables.

TITLE: Characteristics of micro-impurities in middle  
distillate fuels

PERIODICAL: Khimiya i tekhnologiya topliv i masel, no.10, 1962,  
56-59

TEXT: The authors investigated the nature of micro-impurities in fuel TC-1 (TS-1) used in aviation gas-turbine engines. The impurities in the fuels form through the interaction of metal containing compounds with high molecular weight, resinous compounds and moisture. The metal-containing compounds originate from corrosion of tanks and moving parts of various mechanisms, as well as leaching of certain fillers from plastic materials. The relatively coarse particles of the impurities form mainly by the agglomeration of finely dispersed material. The formation of particles having the size of 0.1-1 micron is speeded up by increasing temperature, agitation and excessive pressures.

Card 1/2

Characteristics of micro-impurities.. S/065/62/000/010/003/004  
E075/E136

The inorganic part of the impurities in fuel TS-1 contained 13.7% of Fe after filtration through a filter with 7 micron pores. This indicated that Fe can be present in the fuels in a finely divided state. The second most abundant element in the impurities is Si. The organic part of the contaminants contained S and N, the latter being present only in the organic part, whereas some of the sulphur was present also in the inorganic part of the impurities. To avoid the contamination of the fuels it is advisable to carry out systematic removal of moisture, prevent the formation of high molecular weight resins and exclude metal containing compounds.  
There are 4 tables.

Title : An Apparatus for Study of Occult (Latent) Periods and  
Speed of Conditioned-Reflex Motor Reactions of Man  
under Industrial Conditions

Orig Pub : Gigiyena i sanitariya, 1957, No 2, 74-76

Abstract : The "Electric spark chronoreflexograph" is constructed  
on the principle of burning through paper tape with a  
spark of alternating current. The output signal part  
of the apparatus includes light and sound stimuli. The  
registering part consists of an amplifying transformer  
(the voltage is given with the beginning of signal ac-  
tion), needle electrode and drum on a stand (second  
electrode), rotated by a motor (1 rot./sec). Pressing

of a button by the test subject shuts off the transformer  
and interrupts the registration. The number of dots in  
the beginning of registration determines the latent period,  
the number of missed dots the speed (time) of reaction  
with an accuracy to 0.01 sec. A worm mechanism pushes  
the needle electrode, assuming uninterrupted registration  
along the helix. The latent period of reaction in workers  
at a rolling mill was determined within the limits of  
0.28-0.35 sec., the speed of reaction within 0.04-0.08  
sec. The advantages of the apparatus over analogous ob-  
jects are portability, possibility of utilization under  
the conditions of any industry. -- K.S. Ratner.
